## Chapter 5. Applications

### 5.1 The Dirichlet Problem for the Laplace Equation in a Circular Domain

Consider in the plane $x, y$ the circle $C$, centered at the origin $O$ and with radius $r$. We want to construct a function harmonic regular in $C$, which takes on assigned values on the boundary $\partial C$. It is therefore necessary to solve the problem:

$$
\begin{cases}\Delta_{2} u \equiv \frac{\partial^{2} u}{\partial x^{2}}+\frac{\partial^{2} u}{\partial y^{2}}=0 & (x, y) \in C-\partial C  \tag{5.1}\\ u=f(x, y) & \text { on } \partial C\end{cases}
$$

It is usual to introduce the polar coordinates $(x=\rho \cos \varphi, y=\rho \sin \varphi)$ and to translate the problem (5.1) into the equivalent one (with a simplified notation):

$$
\begin{cases}\frac{\partial^{2} u}{\partial \rho^{2}}+\frac{1}{\rho} \frac{\partial u}{\partial \rho}+\frac{1}{\rho^{2}} \frac{\partial^{2} u}{\partial \varphi^{2}}=0 & \rho \in[0, r), \varphi \in[0,2 \pi]  \tag{5.2}\\ u(r, \varphi)=f(\varphi) & \forall \varphi \in[0,2 \pi]\end{cases}
$$

with the regularity condition for the solution $u$ also for $\rho=0$ and with $f(0)=f(2 \pi)$. Assuming that there exists a solution $u(\rho, \varphi)$ of this problem, for any fixed $\rho<r$ as a function of $\varphi$ it can certainly be expanded in a Fourier series. Therefore, we have:

$$
\begin{equation*}
u(\rho, \varphi)=\frac{1}{2} a_{0}(\rho)+\sum_{k=1}^{\infty}\left(a_{k}(\rho) \cos k \varphi+b_{k}(\rho) \sin k \varphi\right) \tag{5.3}
\end{equation*}
$$

with the coefficients $a_{k}(\rho)$ and $b_{k}(\rho)$ respectively given by:

$$
\begin{equation*}
a_{k}(\rho)=\frac{1}{\pi} \int_{0}^{2 \pi} u(\rho, \xi) \cos k \xi d \xi, \quad b_{k}(\rho)=\frac{1}{\pi} \int_{0}^{2 \pi} u(\rho, \xi) \sin k \xi d \xi \tag{5.4}
\end{equation*}
$$

For the determination of these coefficients there are several methods: separation of variables, transforms or computation of coefficients by using identities of trigonometric series. Here we will operate in a "formal" way which can be verified. Assuming $\forall \rho<r$ that we can derive twice by series, substituting (5.3) into (5.2) we get:

$$
\begin{align*}
& \frac{1}{2}\left[a_{0}^{\prime \prime}(\rho)+\frac{1}{\rho} a_{0}^{\prime}(\rho)\right]+\sum_{k=1}^{\infty}\left[a_{k}^{\prime \prime}(\rho)+\frac{1}{\rho} a_{k}^{\prime}(\rho)-\frac{k^{2}}{\rho^{2}} a_{k}(\rho)\right] \cos k \varphi  \tag{5.5}\\
& \quad+\left[b_{k}^{\prime \prime}(\rho)+\frac{1}{\rho} b_{k}^{\prime}(\rho)-\frac{k^{2}}{\rho^{2}} b_{k}(\rho)\right] \sin k \varphi=0
\end{align*}
$$

a relation that must be verified identically $\forall \rho<r, \forall \varphi \in[0,2 \pi]$. For this to happen, the coefficients of the Fourier series (5.5) must vanish and therefore we find:

$$
\begin{cases}a_{0}^{\prime \prime}(\rho)+\frac{1}{\rho} a_{0}^{\prime}(\rho)=0 & \\ a_{k}^{\prime \prime}(\rho)+\frac{1}{\rho} a_{k}^{\prime}(\rho)-\frac{k^{2}}{\rho^{2}} a_{k}(\rho)=0 & (k=1,2, \ldots) \\ b_{k}^{\prime \prime}(\rho)+\frac{1}{\rho} b_{k}^{\prime}(\rho)-\frac{k^{2}}{\rho^{2}} b_{k}(\rho)=0 & (k=1,2, \ldots)\end{cases}
$$

These are all equations of the Euler type, with the peculiarity of claiming regular solutions even for $\rho=0$. From:

$$
\begin{cases}a_{0}(\rho)=A_{0}+A_{0}^{*} \log \rho & \\ a_{k}(\rho)=A_{k} \rho^{k}+A_{k}^{*} \rho^{-k} \\ b_{k}(\rho)=B_{k} \rho^{k}+B_{k}^{*} \rho^{-k} & (k=1,2, \ldots) \\ (k=1,2, \ldots)\end{cases}
$$

it follows that $A_{0}^{*}=A_{k}^{*}=B_{k}^{*}=0, k=1,2, \ldots$; and lastly that:

$$
a_{0}(\rho)=A_{0}, \quad a_{k}(\rho)=A_{k} \rho^{k}, \quad b_{k}(\rho)=B_{k} \rho^{k} \quad(k=1,2, \ldots)
$$

From Equation (5.4) for $\rho=r$ (as a consequence of the claimed regularity) it follows that:

$$
\begin{aligned}
& A_{0}=\frac{1}{\pi} \int_{0}^{2 \pi} f(\xi) d \xi \\
& A_{k}=a_{k}(r) r^{-k}=\frac{1}{\pi r^{k}} \int_{0}^{2 \pi} f(\xi) \cos k \xi d \xi \quad(k=1,2, \ldots) \\
& B_{k}=b_{k}(r) r^{-k}=\frac{1}{\pi r^{k}} \int_{0}^{2 \pi} f(\xi) \sin k \xi d \xi \quad(k=1,2, \ldots)
\end{aligned}
$$

and then:

$$
\begin{aligned}
& a_{0}(\rho)=\frac{1}{\pi} \int_{0}^{2 \pi} f(\xi) d \xi \\
& a_{k}(\rho)=\frac{1}{\pi}\left(\frac{\rho}{r}\right)^{k} \int_{0}^{2 \pi} f(\xi) \cos k \xi d \xi \quad(k=1,2, \ldots) \\
& b_{k}(\rho)=\frac{1}{\pi}\left(\frac{\rho}{r}\right)^{k} \int_{0}^{2 \pi} f(\xi) \sin k \xi d \xi \quad(k=1,2, \ldots)
\end{aligned}
$$

We thus formally arrive at the expression of the solution:

$$
\begin{aligned}
u(\rho, \varphi)= & \frac{1}{2 \pi} \int_{0}^{2 \pi} f(\xi) d \xi \\
& +\frac{1}{\pi} \sum_{k=1}^{\infty}\left(\frac{\rho}{r}\right)^{k}\left[\int_{0}^{2 \pi} f(\xi) \cos k \xi d \xi \cos k \varphi\right. \\
& \left.+\int_{0}^{2 \pi} f(\xi) \sin k \xi d \xi \sin k \varphi\right] \\
= & \frac{1}{2 \pi} \int_{0}^{2 \pi} f(\xi) d \xi+\frac{1}{\pi} \sum_{k=1}^{\infty}\left(\frac{\rho}{r}\right)^{k} \int_{0}^{2 \pi} f(\xi) \cos k(\varphi-\xi) d \xi
\end{aligned}
$$

The appropriate checks can be carried out on this expression.

### 5.2 The Heat Problem

Let us start with some definitions necessary for the understanding of what follows.

## Gamma and Bessel functions

The Gamma function is the extension of the factorial to non-integer values of the number $n \in \mathbb{N}^{+}$. For $x \neq-n$ it is defined as:

$$
\begin{equation*}
\Gamma(x):=\int_{0}^{+\infty} e^{-t} t^{x-1} d t \quad(x>0) \tag{5.6}
\end{equation*}
$$

In fact, we have:

$$
\Gamma(1):=1, \quad \Gamma(x+1):=x \Gamma(x) \quad \Longrightarrow \quad \Gamma(n+1)=n!
$$

The Bessel functions of the first kind $J_{n}$, together with those of the second kind $Y_{n}$, are widely used in the solutions of mathematical physics problems. They can be defined as solutions of the differential equation:

$$
\begin{equation*}
x^{2} y^{\prime \prime}+x y^{\prime}+\left(x^{2}-n^{2}\right) y=0 \tag{5.7}
\end{equation*}
$$

We get the explicit expression of $J_{n}$ in the form:

$$
\begin{equation*}
J_{n}(x)=\sum_{k=0}^{\infty}(-1)^{k} \frac{(x / 2)^{2 k+n}}{k!(k+n)!} \tag{5.8}
\end{equation*}
$$

which extends to the case of the real values $p$ of the index by replacing the factorial with the Gamma function:

$$
J_{p}(x)=\sum_{k=0}^{\infty}(-1)^{k} \frac{(x / 2)^{2 k+p}}{k!\Gamma(k+p+1)}
$$

One of the well known applications of the Bessel functions [1] is related to the separation of variables in the partial differential equation representing the heat equation for a circular plate.

In fact, denoting by $B$ a circular domain of radius $r=1$ centered at the origin, by $\partial B$ the relevant boundary, by $\kappa$ a constant representing
the known diffusivity and by $f(x, y) \in C^{0}(B)$ the initial temperature, the solution:

$$
u(x, y, t) \in\left[C^{2}(\stackrel{\circ}{B}) \times C^{1}\left(\mathbf{R}^{+}\right)\right] \cap C^{0}\left[\bar{B} \times \mathbf{R}^{+}\right]
$$

of the differential problem:

$$
\begin{cases}\frac{\partial u}{\partial t}=\kappa\left(\frac{\partial^{2} u}{\partial x^{2}}+\frac{\partial^{2} u}{\partial y^{2}}\right) & \text { in } \quad \stackrel{\circ}{B}  \tag{5.9}\\ \left.u(x, y, t)\right|_{(x, y) \in \partial B}=0 & u(x, y, 0)=f(x, y)\end{cases}
$$

putting:

$$
\begin{equation*}
U(\rho, \theta, t)=u(\rho \cos \theta, \rho \sin \theta, t), \quad F(\rho, \theta)=f(\rho \cos \theta, \rho \sin \theta) \tag{5.10}
\end{equation*}
$$

can be represented by the Fourier expansion in terms of exponential, circular and Bessel functions:

$$
\begin{align*}
u(x, y, t)= & U(\rho, \theta, t) \\
= & \sum_{m=0}^{\infty} \sum_{k=1}^{\infty}\left(A_{m, k} \cos m \theta+B_{m, k} \sin m \theta\right) J_{m}\left(j_{k}^{(m)} \rho\right)  \tag{5.11}\\
& \times \exp \left[-\left(j_{k}^{(m)}\right)^{2} \kappa t\right]
\end{align*}
$$

where the coefficients $A_{m, k}, B_{m, k}$ are given by:

$$
\left\{\begin{array}{l}
A_{0, k}=\frac{1}{\pi\left[J_{1}\left(j_{k}^{(0)}\right)\right]^{2}} \int_{0}^{1} \zeta\left[\int_{0}^{2 \pi} F(\zeta, \tau) d \tau\right] J_{0}\left(j_{k}^{(0)} \zeta\right) d \zeta  \tag{5.12}\\
A_{m, k}=\frac{2}{\pi\left[J_{m+1}\left(j_{k}^{(m)}\right)\right]^{2}} \int_{0}^{1} \zeta\left[\int_{0}^{2 \pi} F(\zeta, \tau) \cos m \tau d \tau\right] J_{m}\left(j_{k}^{(m)} \zeta\right) d \zeta \\
B_{m, k}=\frac{2}{\pi\left[J_{m+1}\left(j_{k}^{(m)}\right)\right]^{2}} \int_{0}^{1} \zeta\left[\int_{0}^{2 \pi} F(\zeta, \tau) \sin m \tau d \tau\right] J_{m}\left(j_{k}^{(m)} \zeta\right) d \zeta
\end{array}\right.
$$

and $j_{k}^{(m)}$ denote the zeros of the Bessel function $J_{m}$.

### 5.3 The Wave Problem

Another well known application of the Bessel functions [1] is related to the separation of variables in the partial differential equation representing the free vibrations of a circular membrane (drumhead). Denoting by $B$ a circular domain of radius $r=1$ centered at the origin, by $\partial B$ the relevant boundary, by $a=\sqrt{\tau / \mu}$ a suitable constant (where $\tau$ denotes the tension and $\mu$ the density) and by $f(x, y) \in C^{0}(B)$ the initial displacement, the solution $u \in C^{2}(B-\partial B) \cap C^{0}(\bar{B})$ of the differential problem:

$$
\begin{cases}\frac{\partial^{2} u}{\partial t^{2}}=a^{2}\left(\frac{\partial^{2} u}{\partial x^{2}}+\frac{\partial^{2} u}{\partial y^{2}}\right) & \text { in } \quad \stackrel{\circ}{B}  \tag{5.13}\\ \left.u(x, y, t)\right|_{(x, y) \in \partial B}=0 & u(x, y, 0)=f(x, y), \quad u_{t}(x, y, 0)=0\end{cases}
$$

putting:

$$
\begin{equation*}
U(\rho, \theta)=u(\rho \cos \theta, \rho \sin \theta), \quad F(\rho, \theta)=f(\rho \cos \theta, \rho \sin \theta) \tag{5.14}
\end{equation*}
$$

can be represented by the Fourier expansion in terms of Bessel functions:

$$
\begin{align*}
U(\rho, \theta, t)= & \sum_{m=0}^{\infty} \sum_{k=1}^{\infty} J_{m}\left(j_{k}^{(m)} \rho\right) \cos \left(j_{k}^{(m)} a t\right) \\
& \times\left(A_{m, k} \cos m \theta+B_{m, k} \sin m \theta\right) \tag{5.15}
\end{align*}
$$

where the coefficients $A_{m, k}, B_{m, k}$ are given by:

$$
A_{m, k}= \begin{cases}\frac{2}{\pi\left[J_{m+1}\left(j_{k}^{(m)}\right)\right]^{2}} \int_{0}^{1} \int_{0}^{2 \pi} \rho F(\rho, \theta) J_{m}\left(j_{k}^{(m)} \rho\right) \cos m \theta d \theta d \rho \\ & (m=1,2, \ldots) \\ \frac{1}{\pi\left[J_{1}\left(j_{k}^{(0)}\right)\right]^{2}} \int_{0}^{1} \int_{0}^{2 \pi} \rho F(\rho, \theta) J_{0}\left(j_{k}^{(0)} \rho\right) d \theta d \rho & (m=0)\end{cases}
$$

$$
\begin{array}{r}
B_{m, k}=\frac{2}{\pi\left[J_{m+1}\left(j_{k}^{(m)}\right)\right]^{2}} \int_{0}^{1} \int_{0}^{2 \pi} \rho F(\rho, \theta) J_{m}\left(j_{k}^{(m)} \rho\right) \sin m \theta d \theta d \rho \\
(m=1,2, \ldots) \tag{5.16}
\end{array}
$$

and $j_{k}^{(m)}$ denote the zeros of the Bessel function $J_{m}$.
Moreover, the eigenvalues of a vibrating circular membrane are related to the zeros of the Bessel functions, since the relevant elementary frequencies are given by:

$$
f_{m, k}=\frac{j_{k}^{(m)} a}{2 \pi} \quad(m=0,1, \ldots ; \quad k=1,2, \ldots)
$$
